1 QUESTION-CSIR UGC NET JUNE 2012,Q.50

Let X_1, X_2, \dots be i.i.d $N(1,1)$ random variables. Let $S_n = X_1^2 + X_2^2 + \dots + X_n^2$ for $n \geq 1$. Then

$$\lim_{n \rightarrow \infty} \frac{\text{Var}(S_n)}{n} =$$

- (A) 4
- (B) 6
- (C) 1
- (D) 0

2 SOLUTION-CSIR UGC NET JUNE 2012,Q.50

Lemma 2.1. If two normal random variables X, Y are independent then X^2, Y^2 are also independent.

Proof. : Since X and Y are normal random variables they can take any value in \mathbb{R} (set of real numbers). Now by the independence of X and Y ,

$$\Pr(X = x) = \Pr(X = x | Y = y) \quad (2.0.1)$$

$$\Pr(X = x) = \Pr(X = x | Y = -y) \quad (2.0.2)$$

$$\Pr(X = -x) = \Pr(X = -x | Y = y) \quad (2.0.3)$$

$$\Pr(X = -x) = \Pr(X = -x | Y = -y) \quad (2.0.4)$$

Or Simply,

$$\Pr(X=x \text{ or } X=-x) = \Pr(X=x \text{ or } X=-x | Y=y \text{ or } Y=-y) \quad (2.0.5)$$

Thus

$$\Pr(X^2 = x^2) = \Pr(X^2 = x^2 | Y^2 = y^2) \quad (2.0.6)$$

Implies that the random variables X^2 and Y^2 are independent. \square

Since X_1, X_2, X_3, \dots are mutually independent random variables, by using lemma (2.1), the random variables $X_1^2, X_2^2, X_3^2, \dots$ are also mutually independent.

$$S_n = X_1^2 + X_2^2 + X_3^2 + \dots + X_n^2 \quad (2.0.7)$$

Lemma 2.2. If X and Y are independent random variables

$$\text{Var}(X + Y) = \text{Var}(X) + \text{Var}(Y) \quad (2.0.8)$$

Proof.

$$\text{Var}(X + Y) = E((X + Y)^2) - (E(X + Y))^2 \quad (2.0.9)$$

$$= E(X^2 + Y^2 + 2XY) - (E(X) + E(Y))^2 \quad (2.0.10)$$

$$= \text{Var}(X) + \text{Var}(Y) + 2E(XY) - 2E(X)E(Y) \quad (2.0.11)$$

Now to show that $E(XY) = E(X)E(Y)$ if X, Y are independent

$$E(XY) = \sum_{x,y} xy \Pr(X = x, Y = y) \quad (2.0.12)$$

$$= \sum_{x,y} xy \Pr(X = x) \Pr(Y = y) \quad (2.0.13)$$

$$= \sum_x \sum_y xy \Pr(X = x) \Pr(Y = y) \quad (2.0.14)$$

$$= \sum_x x \Pr(X = x) \sum_y y \Pr(Y = y) \quad (2.0.15)$$

$$\implies E(XY) = E(X)E(Y) \quad (2.0.16)$$

Now substituting (2.0.16) in (2.0.11) we get,

$$\text{Var}(X + Y) = \text{Var}(X) + \text{Var}(Y) \quad (2.0.17)$$

By using lemma (2.2),

$$\text{Var}(S_n) = \text{Var}(X_1^2) + \text{Var}(X_2^2) + \dots + \text{Var}(X_n^2) \quad (2.0.18)$$

\square

Since X_1, X_2, \dots, X_n are identically distributed random variables therefore the random variables $X_1^2, X_2^2, \dots, X_n^2$ are also identical. So,

$$\text{Var}(X_1^2) = \text{Var}(X_2^2) = \dots = \text{Var}(X_n^2) \quad (2.0.19)$$

Now we find the variance of X_1^2 .

$$\text{Var}(X_1^2) = E(X_1^4) - (E(X_1^2))^2 \quad (2.0.20)$$

But we don't know the values of $E(X_1^2)$ and $E(X_1^4)$. Finding the value of $E(X_1^2)$,

$$\text{Var}(X_1) = E(X_1^2) - (E(X_1))^2 \quad (2.0.21)$$

Since X_1 is a $N(1,1)$ random variable $E(X_1) = 1$ and $\text{Var}(X_1) = 1$. Therefore,

$$E(X_1^2) - (1)^2 = 1 \quad (2.0.22)$$

$$E(X_1^2) = 2 \quad (2.0.23)$$

Finding the value of $E(X_1^4)$.

Since X_1 is a $N(1,1)$ random variable pdf of X_1 will be

$$f(X_1) = \frac{1}{\sqrt{2\pi}} \left(e^{-\frac{(X_1-1)^2}{2}} \right) \quad (2.0.24)$$

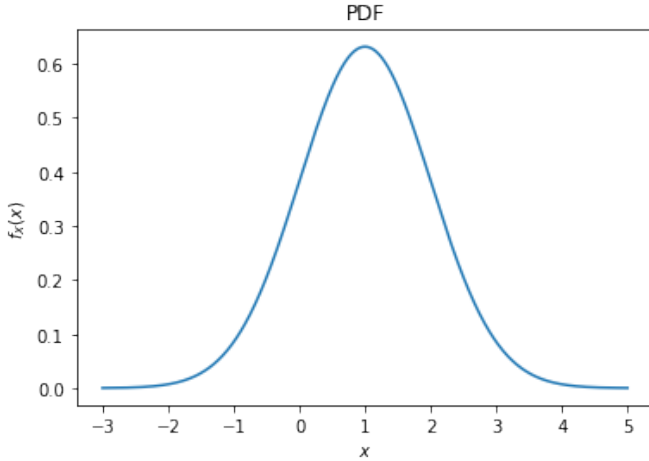

Fig. 4: PDF of X_1, X_2, \dots

Now expected value of X_1^4 will be,

$$E(X_1^4) = \int_{-\infty}^{+\infty} X_1^4 f(X_1) dX_1 \quad (2.0.25)$$

$$= \int_{-\infty}^{+\infty} X_1^4 \left(\frac{1}{\sqrt{2\pi}} \left(e^{-\frac{(X_1-1)^2}{2}} \right) \right) dX_1 \quad (2.0.26)$$

Now put $X_1 - 1 = t$,

$$E(X_1^4) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{+\infty} (t+1)^4 \left(e^{-\frac{t^2}{2}} \right) dt \quad (2.0.27)$$

$$= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{+\infty} (t^4 + 4t^3 + 6t^2 + 4t + 1) \left(e^{-\frac{t^2}{2}} \right) dt \quad (2.0.28)$$

Since $\int_{-\infty}^{+\infty} 4t^3 \left(e^{-\frac{t^2}{2}} \right) dt$ and $\int_{-\infty}^{+\infty} 4t \left(e^{-\frac{t^2}{2}} \right) dt$ are equal to zero, the equation will get reduced to

$$E(X_1^4) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{+\infty} (t^4 + 6t^2 + 1) \left(e^{-\frac{t^2}{2}} \right) dt \quad (2.0.29)$$

Now put $\frac{t}{\sqrt{2}} = x$,

$$E(X_1^4) = \frac{1}{\sqrt{\pi}} \int_{-\infty}^{+\infty} (4x^4 + 12x^2 + 1) \left(e^{-x^2} \right) dx \quad (2.0.30)$$

We know that,

$$\int_{-\infty}^{+\infty} \left(e^{-ax^2} \right) dx = \frac{\sqrt{\pi}}{\sqrt{a}} \quad (2.0.31)$$

$$\frac{d \left(\int_{-\infty}^{+\infty} \left(e^{-ax^2} \right) dx \right)}{da} = \frac{d}{da} \left(\frac{\sqrt{\pi}}{\sqrt{a}} \right) \quad (2.0.32)$$

$$\int_{-\infty}^{+\infty} x^2 \left(e^{-ax^2} \right) dx = \frac{\sqrt{\pi}}{2\sqrt{a^3}} \quad (2.0.33)$$

similarly,

$$\int_{-\infty}^{+\infty} x^4 \left(e^{-ax^2} \right) dx = \frac{3\sqrt{\pi}}{4\sqrt{a^5}} \quad (2.0.34)$$

Using (2.0.31), (2.0.33) and (2.0.34) in (2.0.30) we get,

$$E(X_1^4) = \frac{1}{\sqrt{\pi}} \left(4 \left(\frac{3\sqrt{\pi}}{4} \right) + 12 \left(\frac{\sqrt{\pi}}{2} \right) + \sqrt{\pi} \right) \quad (2.0.35)$$

$$= 3 + 6 + 1 \quad (2.0.36)$$

$$\Rightarrow E(X_1^4) = 10 \quad (2.0.37)$$

Substituting (2.0.23),(2.0.37) in (2.0.20) we get,

$$\text{Var}(X_1^2) = 10 - 4 \quad (2.0.38)$$

$$\implies \text{Var}(X_1^2) = 6 \quad (2.0.39)$$

By the equations (2.0.39),(2.0.18) and (2.0.19), we can conclude that

$$\text{Var}(S_n) = 6n \quad (2.0.40)$$

$$\lim_{n \rightarrow \infty} \frac{\text{Var}(S_n)}{n} = \lim_{n \rightarrow \infty} \frac{6n}{n} = \lim_{n \rightarrow \infty} 6 = 6$$

Hence, option (B) is correct.
